

Part 1: Conversion Factors

Allow a measurement to be transformed from one scale to another.

Three Basic Types

- A. Different prefixes of same base scale (cm -> Km)
- B. Conversions between scales (cm -> in)
- C. Physical Constants  $d=M/V$

A. Different Prefixes of same base scale.

Basic Technique: Set up two equivalence statements

How many micrograms are in a kilogram?

Set up conversion factors based on an equivalence statements.

$$1kg = 10^3 g \text{ and } 1\mu g = 10^{-6} g$$

so, this gives two conversion factors

$$\left(\frac{10^3 g}{1kg}\right) \text{ and } \left(\frac{1\mu g}{10^{-6} g}\right)$$

Use Factor-Label Method

$$1kg \left(\frac{10^3 g}{1kg}\right) \left(\frac{1\mu g}{10^{-6} g}\right) = 10^{3-(-6)} \mu g = 10^9 \mu g$$

Example: Convert 32.4 ng to Mg.

$$32.4ng \left(\frac{10^{-9} g}{ng}\right) \left(\frac{Mg}{10^6 g}\right) = 32.4x10^{(-9-6)} Mg = 32.4x10^{-15} Mg = 3.24x10^{-14} Mg$$

Problems: Solve the following:

1.) 56.4Tbytes = \_\_\_Mbytes

$$56.4Tbytes \left(\frac{10^{12} bytes}{Tbytes}\right) \left(\frac{Mbytes}{10^6 bytes}\right) = 56.4x10^{(12-6)} Mbytes = 56.4x10^6 Mbytes = 5.64x10^7 Mbytes$$

## Conversions of Units Key

C1WS5K

By: Dr. Robert Belford

2.)  $34.6\text{nsec} = \underline{\hspace{2cm}} \text{Gsec}$

$$34.6\text{nsec} \left( \frac{10^{-9} \text{sec}}{\text{nsec}} \right) \left( \frac{\text{Gsec}}{10^9 \text{sec}} \right) = 34.6 \times 10^{(-9-9)} \text{Gsec} = 34.6 \times 10^{(-18)} \text{Gsec} = 3.46 \times 10^{(-17)} \text{Gsec}$$

3.)  $4.0\text{Mg} = \underline{\hspace{2cm}} \text{kg}$

$$4.0\text{Mg} \left( \frac{10^6 \text{g}}{\text{Mg}} \right) \left( \frac{\text{kg}}{10^3 \text{g}} \right) = 4.0 \times 10^{(6-3)} \text{kg} = 4.0 \times 10^3 \text{kg}$$

**Advanced Technique: Set up 1 equivalence statement**

How many micrograms are in a kilogram?

Set up a conversion factor based on an equivalence statement.

$$1\mu\text{g} = 10^{-6} \text{g} \quad \therefore \quad 1\text{g} = 10^6 \mu\text{g}$$

$$1\text{kg} = 10^3 \text{g} \quad \therefore \quad 1\text{g} = 10^{-3} \text{kg}$$

so, this gives two conversion factors

$$a.) \quad \frac{1\text{g}}{1\text{g}} = 1 = \frac{10^6 \mu\text{g}}{10^{-3} \text{kg}} = \frac{10^9 \mu\text{g}}{\text{kg}}$$

or

$$b.) \quad \frac{1\text{g}}{1\text{g}} = 1 = \frac{10^{-3} \text{kg}}{10^6 \mu\text{g}} = \frac{10^{-9} \text{kg}}{\mu\text{g}}$$

Use the ratio which has the starting unit in the denominator and ending unit in the numerator.

Use (a.) to convert kilograms to micrograms

(b.) to convert micrograms to kilograms

**Example:** Convert 32.4 ng to Mg.

$$1\text{g} = 10^{-6} \text{Mg} = 10^9 \text{ng}$$

$$32.4\text{ng} \left( \frac{10^{-6} \text{Mg}}{10^9 \text{ng}} \right) = 32.4 \times 10^{(-6-9)} \text{Mg} = 32.4 \times 10^{-15} \text{Mg} = 3.24 \times 10^{-14} \text{Mg}$$

**Conversion Factors and Scientific Notation**

Convert  $3.57 \times 10^{14} \mu\text{l}$  to ml

$$3.57 \times 10^{14} \mu\text{l} \left( \frac{10^3 \text{ml}}{10^6 \mu\text{l}} \right) = 3.57 \times 10^{(14+3-6)} \text{ml} = 3.57 \times 10^{11} \text{ml}$$

## Conversions of Units Key

C1WS5K

By: Dr. Robert Belford

Problems: Solve the following

1.) Convert  $4.337 \times 10^{14}$  Tl to  $\mu\text{l}$

$$4.337 \times 10^{14} \text{Tl} \left( \frac{10^6 \mu\text{l}}{10^{-12} \text{Tl}} \right) = 4.337 \times 10^{(14+12+6)} \mu\text{l} = 4.337 \times 10^{32} \mu\text{l}$$

2.) Convert  $4.78 \times 10^{24}$  fg to Mg

$$4.78 \times 10^{24} \text{fg} \left( \frac{10^{-6} \text{Mg}}{10^{15} \text{fg}} \right) = 4.78 \times 10^{(24-15-6)} \text{Mg} = 4.78 \times 10^3 \text{Mg}$$

3.) Convert  $2.00 \times 10^{-4}$   $\mu\text{sec}$  to psec

$$2.00 \times 10^{-4} \mu\text{sec} \left( \frac{10^{12} \text{psec}}{10^6 \mu\text{sec}} \right) = 2.00 \times 10^{(-4+12-6)} \text{psec} = 2.00 \times 10^2 \text{psec}$$

**B. Conversions between different scales:**

**YOU MUST SHOW WORK AS SOME CALCULATORS  
AUTOMATICALLY DO CONVERSIONS**

You need equivalence statements between different units.

KNOW:      $2.54\text{cm} = 1\text{in}$  (exact)     (Metric length to English Length)  
               $1\text{ml} = 1\text{cm}^3$              (Metric volume to Metric length cubed)

Note\* Many of these are not exact, see back cover of book.

How many dm are in an object which is 2.45 feet long?

given  $12\text{in} = 1\text{ft}$ ,

$$2.450 \text{ft} \left( \frac{12\text{in}}{\text{ft}} \right) \left( \frac{2.54\text{cm}}{\text{in}} \right) \left( \frac{10^1 \text{dm}}{10^2 \text{cm}} \right) = 7.4676 \text{dm} = 7.468 \text{dm}$$

How many gallons are in a cuboid can that is 2.05 ft wide, 12.4 inches long and 1.30 yards deep?

Given:  $4 \text{qt} = 1 \text{gal}$ ,  $1.057 \text{qt} = 1\text{L}$ ,  $12\text{in} = 1\text{ft}$ ,  $3 \text{ft} = 1 \text{yd}$ :

## Conversions of Units Key

C1WS5K

By: Dr. Robert Belford

$$2.05 \text{ ft} (12.4 \text{ in}) (1.30 \text{ yd}) \left( \frac{3 \text{ ft}}{\text{yd}} \right) \left( \frac{12 \text{ in}}{\text{ft}} \right)^2 \left( \frac{2.54 \text{ cm}}{\text{in}} \right)^3 \left( \frac{1 \text{ mL}}{1 \text{ cm}^3} \right) \left( \frac{1 \text{ L}}{1000 \text{ mL}} \right) \left( \frac{1.057 \text{ qt}}{1 \text{ L}} \right) \left( \frac{\text{gal}}{4 \text{ qt}} \right) = 61.8 \text{ gal}$$

Problems:

1.) How many square inches are in a rectangle which is 3.24ft by 2.67 yd?

$$3.24 \text{ ft} (2.67 \text{ yd}) \left( \frac{3 \text{ ft}}{\text{yd}} \right) \left( \frac{12 \text{ in}}{\text{ft}} \right)^2 = 3737.1456 \text{ in}^2 = 3740 \text{ in}^2$$

2.) How many cubic inches are in 1.00 mL?

$$1.00 \text{ mL} \left( \frac{\text{cm}^3}{1 \text{ mL}} \right) \left( \frac{\text{in}}{2.54 \text{ cm}} \right)^3 = 0.0610 \text{ in}^3$$

3.) How many cubic feet are in 1.00 TL?

$$1.00 \text{ TL} \left( \frac{10^3 \text{ mL}}{10^{-12} \text{ TL}} \right) \left( \frac{1 \text{ cm}^3}{1 \text{ mL}} \right) \left( \frac{\text{in}}{2.54 \text{ cm}} \right)^3 \left( \frac{\text{ft}}{12 \text{ in}} \right)^3 = 3.53 \times 10^{10} \text{ ft}^3$$

4.) How many kL are in a cube which is  $3.24 \times 10^{21}$  mm on each side?

$$(3.24 \times 10^{21} \text{ mm})^3 \left( \frac{10^2 \text{ cm}}{10^3 \text{ mm}} \right)^3 \left( \frac{\text{mL}}{1 \text{ cm}^3} \right) \left( \frac{10^{-3} \text{ kL}}{10^3 \text{ mL}} \right) = 3.40 \times 10^{55} \text{ kL}$$

5.) How many square inches are in a rectangle which is  $1.75 \times 10^{11}$  mm by  $7.34 \times 10^{-13}$  km

$$1.75 \times 10^{11} \text{ mm} (7.34 \times 10^{-13} \text{ km}) \left( \frac{\text{cm}}{10 \text{ mm}} \right) \left( \frac{10^2 \text{ cm}}{10^{-3} \text{ km}} \right) \left( \frac{\text{in}}{2.54 \text{ cm}} \right)^2 = 199 \text{ in}^2$$

6.) How many mL are in an cuboid that is  $2.00 \times 10^{21}$  mm by  $3.00 \times 10^2$  yard by  $5.00 \times 10^{18}$  ft?

$$2.00 \times 10^{21} \text{ mm} (3.00 \times 10^2 \text{ yd}) (5.00 \times 10^{18} \text{ ft}) \left( \frac{3 \text{ ft}}{\text{yd}} \right) \left( \frac{12 \text{ in}}{\text{ft}} \right)^2 \left( \frac{1 \text{ cm}}{10 \text{ mm}} \right) \left( \frac{2.54 \text{ cm}}{1 \text{ in}} \right)^2 \left( \frac{\text{mL}}{1 \text{ cm}^3} \right) = 8.36 \times 10^{44} \text{ mL}$$

## Conversions of Units Key

C1WS5K

By: Dr. Robert Belford

### C. Physical Constants

These are typically measured and have significant digits.

Density: Allows conversion from Mass to Volume.

$$D=M/V$$

How many pounds does a 61.8 gal container weight at a given temperature if water has a density of 0.98g/mL?

$$61.8 \text{ gal} \left( \frac{4 \text{ qt}}{\text{gal}} \right) \left( \frac{L}{1.057 \text{ qt}} \right) \left( \frac{1000 \text{ mL}}{L} \right) \left( \frac{0.98 \text{ g}}{\text{mL}} \right) \left( \frac{\text{lb}}{453.6 \text{ g}} \right) = 505.27 \text{ lb} = 510 \text{ lb}$$

Note the answer has 2 significant digits because of the density

Problems:

1.) If the density of gold is 19.3g/ml, what is it in lb/in<sup>3</sup>?

$$\frac{19.3 \text{ g}}{\text{mL}} \left( \frac{\text{mL}}{\text{cm}^3} \right) \left( \frac{2.54 \text{ cm}}{\text{in}} \right)^3 \left( \frac{\text{lb}}{453.59 \text{ g}} \right) = 0.697 \text{ lb/in}^3$$

2.) What is the mass a cubic foot of mercury (d<sub>Hg</sub>=13.6 g/ml), consider it to be 1.00 ft on each side

$$d = \frac{m}{V} \Rightarrow m = dV = \frac{13.6 \text{ g}}{\text{mL}} (1 \text{ ft})^3 \left( \frac{12 \text{ in}}{1 \text{ ft}} \right)^3 \left( \frac{2.54 \text{ cm}}{\text{in}} \right)^3 \left( \frac{\text{mL}}{1 \text{ cm}^3} \right) = 385 \text{ kg}$$

3.) Osmium is the densest natural element with a density of 22.61 g/ml. What would be the mass of 1.00 gallon of osmium?

$$d = \frac{m}{V} \Rightarrow m = dV = \frac{22.61 \text{ g}}{\text{mL}} (1.00 \text{ gal}) \left( \frac{3.785 \text{ l}}{1 \text{ gal}} \right) \left( \frac{1000 \text{ ml}}{\text{l}} \right) = 85.6 \text{ kg}$$

4.) What volume of water would have the same mass as 1.00 gallon of osmium?

$$85.6 \text{ kg} \left( \frac{1 \text{ L}}{\text{kg}} \right) = 85.6 \text{ L}$$

5.) What is the density of water in lb/in<sup>3</sup>?

## Conversions of Units Key

C1WS5K

By: Dr. Robert Belford

$$\frac{1g}{mL} \left( \frac{mL}{cm^3} \right) \left( \frac{2.54cm}{in} \right)^3 \left( \frac{lb}{453.59g} \right) = 0.0361 lb/in^3$$

**Specific Gravity:** The specific gravity is the ration of the density of one substance to another. One of the advantages of specific gravity is that it has the same value, not matter what units were used in calculating it.

1.) Using densities in units of g/ml, calculate the specific gravity of gold?

$$\frac{19.3g/mL}{1g/mL} = 19.3$$

2.) Calculate the specific gravity of gold from densities in units of lb/in<sup>3</sup> (question 1 and 5 above).

$$\frac{0.697lb/in^3}{0.0361lb/in^3} = 19.3$$

## Part 2 Temperature Conversion and equation for a straight line

$$T_C = T_K - 273.15$$

## Temperature Measurement

## Temperature Conversions

$$y = mx + b$$

$$^{\circ}\text{F} = \frac{212 - 32}{100 - 0} ^{\circ}\text{C} + 32$$

$$= \frac{180}{100} ^{\circ}\text{C} + 32$$

$$= \frac{9}{5} ^{\circ}\text{C} + 32$$

$$= 1.8^{\circ}\text{C} + 32$$

## Temperature Conversions

$$^{\circ}C = \frac{1}{1.8} (^{\circ}F - 32)$$

$$^{\circ}F = 1.8(^{\circ}C) + 32$$

At what Temperature do these  
scales converge?

$$-40^{\circ}C = -40^{\circ}F$$

## Temperature Conversions

## +40/-40 Method

1. Add 40 to number
2. If going from C to F, multiply by 1.8  
(the change is greater)

If going from F to C, divide by 1.8  
(the change is smaller)

3. Subtract 40 from number

Convert 98.6°F to C° and K.

$$(98.6 + 40) \left( \frac{1}{1.8} \right) - 40 = 37.0^{\circ}C$$

$$37.0 + 273.15 = 310.2K$$

## Conversions of Units Key

C1WS5K

By: Dr. Robert Belford

What is Absolute Zero in Fahrenheit?

$$0K = -273.15^{\circ}C$$

$$(-273.15 + 40)(1.8) - 40 = -459.67^{\circ}F$$

Problems:

1. El Azizia Libya is considered the hottest place on earth where the air temperature was  $57.8^{\circ}C$  on September 13, 1922.

a. What is that temperature in Fahrenheit?

$$(57.8 + 40)1.8 - 40 = 136^{\circ}F$$

b. What is that temperature in Kelvin?

$$56.8 + 273.15 = 331K$$

2. Vostok station in Antarctica has the coldest temperature recorded on earth at  $-129^{\circ}F$ .

a. What is that temperature in  $^{\circ}C$ ?

$$\frac{(-129 + 40)}{1.8} - 40 = -89.4^{\circ}C$$

b. What is that temperature in Kelvin?

$$\frac{(-129 + 40)}{1.8} - 40 + 273.15 = 184K$$

Part 3: Percent: - way of expressing a fraction

Fraction = part/whole

Percent = fraction(100)

Note, the some of the parts = the whole  
(sum of fractions = 1 sum of percents = 100)

What is the percent salt if 23.5 g of salt is mixed with 91 g water?

$$\begin{aligned} \% \text{Salt} &= \left( \frac{m_{\text{Salt}}}{m_{\text{Salt}} + m_{\text{Water}}} \right) 100 = \frac{23.5 \text{g}}{23.5 \text{g} + 91 \text{g}} 100 \\ &= \frac{23.5}{114.5} 100 = .20524(100) = 20.5\% \text{ salt} \end{aligned}$$

What is the percent water if 23.5 g of salt is mixed with 91 g water?

$$\begin{aligned} \% \text{Water} &= \left( \frac{m_{\text{Water}}}{m_{\text{Salt}} + m_{\text{Water}}} \right) 100 = \frac{91 \text{g}}{23.5 \text{g} + 91 \text{g}} 100 \\ &= \frac{91}{114.5} 100 = .79476(100) = 79\% \text{ salt} \end{aligned}$$

Note, there are two ways as we already know % salt, be BE CAREFUL of Sig Figs.

Whole - % salt = % water

100% - 20.5% = 79.5%

(exact) (meas)

This second way is considered wrong

What mass of Water do you need to add to 55.4g of salt to make a solution that is 15.0% Salt?

$$\% \text{ salt} = \frac{m_s}{m_s + m_w} (100)$$

$$\text{Fraction salt} = f_s = \frac{\% \text{ salt}}{100}$$

$$f_s = \frac{m_s}{m_s + m_w}$$

$$f_s (m_s + m_w) = m_s$$

$$f_s m_s + f_s m_w = m_s$$

$$f_s m_w = m_s - f_s m_s = m_s (1 - f_s)$$

$$m_w = \frac{(1 - f_s)}{f_s} m_s = \frac{(1 - .150)}{.150} 55.4 \text{ g} = \frac{.850}{.150} 55.4 \text{ g} = 314 \text{ g}$$

Note, the last eq could have been written as

$$m_w = \frac{f_w}{f_s} m_s \quad \text{which can be rearranged to} \quad \frac{m_w}{m_s} = \frac{f_w}{f_s}$$

Problems:

1. What is the mass of water in a solution which is 34.5% water and has 23.6g salt?

$$f_s = \frac{m_s}{m_s + m_w}$$

$$f_s (m_s + m_w) = m_s$$

$$f_s m_s + f_s m_w = m_s$$

$$f_s m_w = m_s - f_s m_s = m_s (1 - f_s)$$

$$m_w = \frac{(1 - f_s)}{f_s} m_s = \frac{f_w}{f_s} m_s = \frac{.345}{.655} 23.6 \text{ g} = 12.4 \text{ g}$$

2. What is the mass of water in a solution which is 34.5% salt and has 23.6g salt?

## Conversions of Units Key

C1WS5K

By: Dr. Robert Belford

$$f_s = \frac{m_s}{m_s + m_w}$$

$$f_s (m_s + m_w) = m_s$$

$$f_s m_s + f_s m_w = m_s$$

$$f_s m_w = m_s - f_s m_s = m_s (1 - f_s)$$

$$m_w = \frac{(1 - f_s)}{f_s} m_s = \frac{(1 - .345)}{.345} 23.6g = 44.8g$$

3. What is the mass of salt in a solution which is 34.5% water and has 23.6g water?

$$\frac{f_w}{f_s} = \frac{m_w}{m_s}$$

$$m_s = m_w \frac{f_s}{f_w} = 23.6 \left( \frac{.655}{.345} \right) = 44.6g$$

4. What is the mass of salt in a solution which is 34.5% salt and has 23.6g water?

$$\frac{f_w}{f_s} = \frac{m_w}{m_s}$$

$$m_s = m_w \frac{f_s}{f_w} = 23.6 \left( \frac{.345}{.655} \right) = 12.4g$$
