The absorbance (symbol: A), usually the y axis of a uv spectrum, is defined as follows.

\[
A = \log \left( \frac{l_0}{I} \right)
\]

\(l_0\) = intensity of the light entering the sample

\(I\) = intensity of the light leaving the sample

If the sample absorbs no light,

\[
I = l_0,
\]

\[
\frac{l_0}{I} = 1,
\]

\[
A = \log \frac{l_0}{I} = \log 1 = 0.
\]

If the sample absorbs light,

\[
l < l_0,
\]

\[
\frac{l_0}{I} > 1,
\]

\[
A = \log \frac{l_0}{I} > 0
\]

Thus, the greater the amount of the light absorbed by the sample, the larger the absorbance.
