Consider a compound that has the following structural formula.

\[
X - C - C - Y
\]

\[X, Y = \text{any ligand except hydrogen}\]

The following staggered conformation, in which the dihedral angle between \(X\) and \(Y\) is 180°, is called the anti conformation.

\[
\begin{array}{c}
\text{H} \\
\text{H} \\
\text{X} \\
\text{H} \\
\text{H} \\
\text{H} \\
\text{Y} \\
\text{H} \\
\end{array}
\]

eg. butane

\[
\begin{array}{c}
\text{CH}_3 \\
\text{H} \\
\text{H} \\
\text{C} \\
\text{C} \\
\text{C} \\
\text{CH}_3 \\
\text{H} \\
\text{H} \\
\end{array}
\]

see also gauche conformation
