Hofmann rearrangement, also known as Hofmann degradation and not to be confused with Hofmann elimination, is the reaction of a primary amide with a halogen (chlorine or bromine) in strongly basic (sodium or potassium hydroxide) aqueous medium, which converts the amide to a primary amine. eg:

\[
\text{EtCONH}_2 \xrightarrow{\text{Br}_2, \text{NaOH}} \text{EtNH}_2 + \text{CO}_2
\]

**Mechanism**

see also nitrene
