Sodium bicarbonate (baking soda), NaHCO$_3$, can be purified by dissolving it in hot water (60 °C), filtering to remove insoluble impurities, cooling to 0 °C to precipitate solid NaHCO$_3$, and then filtering to remove the solid, leaving soluble impurities in solution. Any NaHCO$_3$ that remains in solution is not recovered. The solubility of NaHCO$_3$ in hot water of 60 °C is 164 g/L. Its solubility in cold water of 0 °C is 69 g/L. What is the percent yield of NaHCO$_3$ when it is purified by this method?
