Aldehydes and ketones can be converted to a hydrazine derivative by reaction with hydrazine. These "hydrazones" can be further converted to the corresponding alkane by reaction with base and heat. These two steps can be combined into one reaction called the Wolff-Kishner Reduction which represents a general method for converting aldehydes and ketones into alkanes. Typically a high boiling point solvent, such as ethylene glycol, is used to provide the high temperatures needed for this reaction to occur. Note! Nitrogen gas is produced as part of this reaction.

**Reaction of Aldehydes or Ketones with Hydrazine Produces a Hydrazone**

![Reaction of Aldehydes or Ketones with Hydrazine Produces a Hydrazone](image1)

**Reaction with a Base and Heat Converts a Hydrazone to an Alkane**

![Reaction with a Base and Heat Converts a Hydrazone to an Alkane](image2)

**Both Reactions Together Produces the Wolff-Kishner Reduction**

![Both Reactions Together Produces the Wolff-Kishner Reduction](image3)

**Example**

![Example](image4)

**Mechanism of the Wolff-Kishner Reduction**

1) Deprotonation of Nitrogen
2) Protonation of the Carbon

3) Deprotonation of Nitrogen

4) Protonation of Carbon
